

NOVEL COMPOUNDS

BACKGROUND OF THE INVENTION

1. Field of the invention

5 The present invention relates to compounds that are therapeutic, and more particularly, to compounds that are effective in treating pain, cancer, multiple sclerosis, Parkinson's disease, Huntington's chorea and/or Alzheimer's disease.

2. Discussion of Relevant Technology

10 Pain management has been studied for many years. Cannabinoid receptor (e.g., CB₁ receptor, CB₂ receptor) ligands such as agonists, antagonists and inverse agonists may produce relief of pain in a variety of animal models by interacting with CB₁ and/or CB₂ receptors. Generally, CB₁ receptors are located predominately in the central nervous system, whereas CB₂ receptors are located primarily in the periphery
15 and are primarily restricted to the cells and tissues derived from the immune system.

While CB₁ receptor agonists and mixed (CB₁/CB₂) receptor agonists, such as tetrahydrocannabinol (THC) and opiate drugs, are effective in anti-nociception models in animals, they tend to exert many undesired CNS side-effects, e.g., psychoactive side effects and the abuse potential of opiate drugs. These undesired
20 CNS side effects are known to be mediated by the CB₁ receptors. In contrast, CB₂ receptor agonists may manage pain in humans or animals without causing those undesired CNS side effects due to the general location of CB₂ receptors and other factors.

Therefore, there is a need for CB₂ receptor ligands such as agonists useful in
25 managing pain and/or treating other symptoms or diseases.

Generally, pharmaceutically acceptable salts of compounds of the present invention may be obtained using standard procedures well known in the art, for example by reacting a sufficiently basic compound, for example an alkyl amine with a suitable acid, for example, HCl or acetic acid, to afford a physiologically acceptable
25 anion. It may also be possible to make a corresponding alkali metal (such as sodium, potassium, or lithium) or an alkaline earth metal (such as a calcium) salt by treating a compound of the present invention having a suitably acidic proton, such as a carboxylic acid or a phenol with one equivalent of an alkali metal or alkaline earth metal hydroxide or alkoxide (such as the ethoxide or methoxide), or a suitably basic
30 organic amine (such as choline or meglumine) in an aqueous medium, followed by conventional purification techniques.

In one embodiment, the compound of formula I above may be converted to a pharmaceutically acceptable salt or solvate thereof, particularly, an acid addition salt

such as a hydrochloride, hydrobromide, phosphate, acetate, fumarate, maleate, tartrate, citrate, methanesulphonate or *p*-toluenesulphonate.

The compounds of the invention may have activity as pharmaceuticals, in particular as modulators or ligands such as agonists, partial agonists, inverse agonist
5 or antagonists of CB₂ receptors. In one embodiment, the compounds of the invention may exhibit selective activity as agonists at CB₂ receptors, and are useful in the relief of pain, particularly chronic pain, e.g., chronic inflammatory pain, neuropathic pain, back pain, cancer pain and visceral pain. Compounds of the present invention may also be useful in treating acute pain. Additionally, compounds of the present
10 invention may be useful in other disease states in which degeneration or dysfunction of CB₂ receptors is present or implicated.

15 formula I, or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined in the manufacture of a medicament for use in therapy.

25 composition by any route including orally, intramuscularly, subcutaneously, topically, intranasally, intraperitoneally, intrathoracically, intravenously, epidurally, intrathecally, intracerebroventricularly and by injection into the joints.

In one embodiment of the invention, the route of administration may be oral, intravenous or intramuscular.

30 The dosage will depend on the route of administration, the severity of the disease, age and weight of the patient and other factors normally considered by the attending physician, when determining the individual regimen and dosage level at the most appropriate for a particular patient.

For preparing pharmaceutical compositions from the compounds of this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories.

5 A solid carrier can be one or more substances, which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or table disintegrating agents; it can also be an encapsulating material.

 In powders, the carrier is a finely divided solid, which is in a mixture with the finely divided compound of the invention, or the active component. In tablets, the
10 active component is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

 For preparing suppository compositions, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed therein by, for example, stirring. The molten homogeneous mixture is then
15 poured into convenient sized moulds and allowed to cool and solidify.

 Suitable carriers are magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter, and the like.

 The term composition is also intended to include the formulation of the active
20 component with encapsulating material as a carrier providing a capsule in which the active component (with or without other carriers) is surrounded by a carrier which is thus in association with it. Similarly, cachets are included.

 Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

25 Liquid form compositions include solutions, suspensions, and emulsions. For example, sterile water or water propylene glycol solutions of the active compounds may be liquid preparations suitable for parenteral administration. Liquid compositions can also be formulated in solution in aqueous polyethylene glycol solution.

30 Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavoring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous

material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical formulation art.

Depending on the mode of administration, the pharmaceutical composition
5 will preferably include from 0.05% to 99%w (per cent by weight), more preferably from 0.10 to 50%w, of the compound of the invention, all percentages by weight being based on total composition.

A therapeutically effective amount for the practice of the present invention may be determined, by the use of known criteria including the age, weight and
10 response of the individual patient, and interpreted within the context of the disease which is being treated or which is being prevented, by one of ordinary skill in the art.

Within the scope of the invention is the use of any compound of formula I as defined above for the manufacture of a medicament.

Also within the scope of the invention is the use of any compound of formula I
15 for the manufacture of a medicament for the therapy of pain.

Additionally provided is the use of any compound according to Formula I for the manufacture of a medicament for the therapy of various pain conditions including, but not limited to: acute pain, chronic pain, neuropathic pain, acute pain, back pain, cancer pain, and visceral pain.

20 A further aspect of the invention is a method for therapy of a subject suffering from any of the conditions discussed above, whereby an effective amount of a compound according to the formula I above, is administered to a patient in need of such therapy.

Additionally, there is provided a pharmaceutical composition comprising a
25 compound of Formula I, or a pharmaceutically acceptable salt thereof, in association with a pharmaceutically acceptable carrier.

Particularly, there is provided a pharmaceutical composition comprising a compound of Formula I, or a pharmaceutically acceptable salt thereof, in association
30 with a pharmaceutically acceptable carrier for therapy, more particularly for therapy of pain.

Further, there is provided a pharmaceutical composition comprising a compound of Formula I, or a pharmaceutically acceptable salt thereof, in association

with a pharmaceutically acceptable carrier use in any of the conditions discussed above.

In one embodiment, the compounds of the invention are found to be active towards CB₂ receptors in warm-blooded animals, e.g., human. Particularly the compounds of the invention are found to be effective CB₂ receptor agonists. *In vitro* assays, *infra*, demonstrate these activities. In these *in vitro* assays, a compound is tested for their activity toward CB₂ receptors and dissociation constant (K_i) is obtained to determine the selective activity for a particular compound towards CB₂ receptors by measuring IC₅₀ of the compound. In the current context, IC₅₀ generally refers to the concentration of the compound at which 50% displacement of a standard radioactive CB₂ receptor ligand has been observed. Generally, a lower K_i for a particular compound towards CB₂ receptors means that the particular compound is a stronger ligand towards the CB₂ receptors. As a result, compounds with relatively low K_i towards CB₂ receptors are relatively strong CB₂ receptor ligands or potent CB₂ receptor agonists.

The activities of the compound towards CB₁ receptors are also measured in a similar assay. It is known that even though CB₁ receptor agonists are also effective in relieving or managing pains, their use is often associated with undesired CNS side-effects, e.g., psychoactive side effects and abuse potential. In one embodiment, we surprisingly find the particular compounds of the present invention tend to bind weakly to CB₁ receptors, have relatively high K_i's towards particular CB₁ receptors and thus low binding affinity toward CB₁ receptors. As a result, the compounds may show no or less side effects in treating pain in comparison with conventional cannabinoids.

CB₂ receptors are generally expressed in peripheral tissues, particularly in the immuno-competent and inflammatory cells, which are believed to have therapeutic effects related to immunomodulation, inflammation and bronchial constriction. The CB₂ receptor selective ligands such as CB₂ receptor agonists may have therapeutic utility in controlling diseases associated with these conditions.

It is substantially established that CB₂ receptor ligands (e.g. agonists) are generally effective in treating or managing pain in warm-blooded animals with little side effects such as addiction and the CB₂ receptor ligands may have similar effects on humans. For example, CB₂ receptors have been found to be expressed in

peritoneal mast cells which play a crucial role in amplifying the key nerve growth factor (NGF) which may induce inflammatory hyperalgesia. CB₂ receptors have also been shown to be involved in the attenuation of nitric oxide production from macrophages upon treatment of LPS.

5 In addition, *in vivo* pain models have shown that CB₂ receptor agonists may induce analgesia. In particular, it has been found that the expression of the CB₂ receptors is induced under conditions of immune cell activation and that a CB₂ agonist elicits anti-inflammatory and peripheral analgesic activity. Moreover, it has been shown that CB₂ activation inhibits mechanical hyperalgesia associated with
10 nerve injury. Further, it has been demonstrated that peripheral CB₂ receptors may mediate antinociception in the rat. Consequentially, in one embodiment, the compounds that show a lower K_i in the *in vitro* assays disclosed in the invention may be suitable to be used in therapies such as pain relief or pain management.

 CB₂ receptor selective ligands such as CB₂ receptor agonists (sometimes also
15 called CB₂ selective cannabinoids) have been shown to induce apoptosis in glioma cells, in both *in vitro* and *in vivo* settings. Further evidence has supported the antiproliferative effects of CB₂ receptor agonists on breast and prostate cancer cells. CB₂ receptor agonists can also induce tumor suppression in a rat model in which rat glioma C6 cells are inoculated intracerebrally in the rats. Both clinical and non-
20 clinical studies also show that CB₂ receptor ligands may also have a positive effect on multiple sclerosis.

 CB₂ receptor agonists may also be used in other therapies related directly or indirectly to immunomodulation such as treating asthma, bronchitis, chronic obstructive pulmonary disease (COPD), reversible airway obstruction, adult
25 respiratory distress syndrome, psoriasis, rheumatoid arthritis, and allergy. CB₂ receptor agonists may also be effective in treating Parkinson's disease, Huntington's chorea and Alzheimer's disease, and Crohn's disease. CB₂ receptor agonists may also be useful in transplant rejection therapy.

 Therefore, in another aspect, the compounds of the invention may be useful
30 and effective in treating LPS, pain, multiple sclerosis, asthma, bronchitis, chronic obstructive pulmonary disease (COPD), reversible airway obstruction, adult respiratory distress syndrome, psoriasis, rheumatoid arthritis, allergy, Parkinson's

disease, Huntington's chorea and Alzheimer's disease, Crohn's disease, and transplant rejection.

In a further aspect, the present invention provides a method of preparing a compound of formula I.

 25 reducing or hydrogenation agent (e.g., $NaCNBH_3$, $NaBH(OAc)_3$), optionally further in the presence of an acid such as acetic acid, to form a compound of formula I.

10 EXAMPLES

The invention will further be described in more detail by the following Examples which describe methods whereby compounds of the present invention may be prepared, purified, analyzed and biologically tested, and which are not to be construed as limiting the invention.

15

Example 1: Biological Evaluation

hCB₁ and hCB₂ receptor binding

Human CB₁ receptor from Receptor Biology (hCB₁) or human CB₂ receptor from BioSignal (hCB₂) membranes are thawed at 37 °C, passed 3 times through a 25-gauge blunt-end needle, diluted in the cannabinoid binding buffer (50 mM Tris, 2.5 mM EDTA, 5 mM MgCl₂, and 0.5 mg/mL BSA fatty acid free, pH 7.4) and aliquots containing the appropriate amount of protein are distributed in 96-well plates. The IC₅₀ of the compounds of the invention at hCB₁ and hCB₂ are evaluated from 10-point dose-response curves done with ³H-CP55,940 at 20000 to 25000 dpm per well (0.17-0.21 nM) in a final volume of 300 µl. The total and non-specific binding are determined in the absence and presence of 0.2 µM of HU210 respectively. The plates are vortexed and incubated for 60 minutes at room temperature, filtered through Unifilters GF/B (presoaked in 0.1% polyethyleneimine) with the Tomtec or Packard harvester using 3 mL of wash buffer (50 mM Tris, 5 mM MgCl₂, 0.5 mg BSA pH 7.0). The filters are dried for 1 hour at 55 °C. The radioactivity (cpm) is counted in a TopCount (Packard) after adding 65 µl/well of MS-20 scintillation liquid.

hCB₁ and hCB₂ GTPγS binding

Human CB₁ receptor from Receptor Biology (hCB₁) or human CB₂ receptor membranes (BioSignal) are thawed at 37 °C, passed 3 times through a 25-gauge blunt-end needle and diluted in the GTPγS binding buffer (50 mM Hepes, 20 mM NaOH, 100 mM NaCl, 1 mM EDTA, 5 mM MgCl₂, pH 7.4, 0.1% BSA). The EC₅₀ and E_{max} of the compounds of the invention are evaluated from 10-point dose-response curves done in 300µl with the appropriate amount of membrane protein and 100000-130000 dpm of GTPγ³⁵S per well (0.11 –0.14 nM). The basal and maximal stimulated binding is determined in absence and presence of 1 µM (hCB₂) or 10 µM (hCB₁) Win 55,212-2 respectively. The membranes are pre-incubated for 5 minutes with 56.25 µM (hCB₂) or 112.5 µM (hCB₁) GDP prior to distribution in plates (15 µM (hCB₂) or 30 µM (hCB₁) GDP final). The plates are vortexed and incubated for 60 minutes at room temperature, filtered on Unifilters GF/B (presoaked in water) with the Tomtec or Packard harvester using 3 ml of wash buffer (50 mM Tris, 5 mM MgCl₂, 50 mM NaCl, pH 7.0). The filters are dried for 1 hour at 55 °C. The radioactivity (cpm) is counted in a TopCount (Packard) after adding 65 µl/well of MS-20 scintillation liquid. Antagonist reversal studies are done in the same way

except that (a) an agonist dose-response curve is done in the presence of a constant concentration of antagonist, or (b) an antagonist dose-response curve is done in the presence of a constant concentration of agonist.

Based on the above assays, the dissociation constant (K_i) for a particular compound of the invention towards a particular receptor is determined using the following equation:

$$K_i = IC_{50}/(1+[rad]/K_d),$$

Wherein IC_{50} is the concentration of the compound of the invention at which 50% displacement has been observed;

[rad] is a standard or reference radioactive ligand concentration at that moment; and

K_d is the dissociation constant of the radioactive ligand towards the particular receptor.
